BURNDOWN CHART FOR SPRINT 2

4.ANSWERS

1. Did your estimations reflect the actual effort?

My estimations were reasonably close to the actual effort. Most tasks were completed within their estimated story points, although some tasks required slightly more effort than expected. This helped me understand the importance of considering task complexity when estimating.

2. Was your backlog well-prioritized?

Yes, I prioritized the backlog based on the importance of the features. I focused on the core cloud cost management and optimization features first, followed by the less critical features.

3. How did your simulated sprint align with your plan?

My simulated sprints generally aligned with my original plan. I was able to organize the tasks into sprints and move them through the workflow from **To Do** → **In Progress** → **Done**. The simulation helped me understand how sprint planning works in practice.

4. What insights did the burndown chart give about your capacity?

The burndown chart showed how my remaining story points decreased during the sprint. Since I completed the tasks progressively, it gave me an idea of how much work I could realistically handle within a sprint and helped me understand the importance of maintaining a consistent pace.
